Sampling Issues

The Chain of Custody (COC) record forms for SDGs 06-1689, 06-1704, and 06-1764 did not specify a sample to be used for laboratory quality control (QC). As a result, the laboratory selected samples OC2-MW9A-W-0-171, OC2-MW11-W-1-177, and OC2-MW18B-W-0-192, respectively, for QC analysis. The effect on data quality is not known.

Additional Comments

As directed by the EPA TOM, a Tier 2 data review was performed (review all QC results and calibrations, minus calculation check). A Table 1A is not requested.

The calculated percent differences (%Ds) for calibration standards 0.20 µg/L and 5.0 µg/L are 25 %D and 23 %D, respectively, and exceed the 10% limit. The 10% limit was derived from the ±10% limit used in method 218.6 to determine the linear dynamic range upper limit. The high %D indicates that the calibration may not be linear at the low end of the curve. Since the analytical method does not require analysis of a practical quantitation limit (PQL) standard to confirm linearity of the calibration curve at the 1 µg/L PQL, results less than 20 µg/L may have a high bias.

The method specifies the sample pH be adjusted to 9.0 to 9.5 prior to analysis; however, there is no method specific requirement to document the sample pH. The pH of the samples prior to analysis could not be evaluated. The effect on data quality is not known.

Initial and continuing calibration blank data were not provided and could not be evaluated. The effect on data quality is not known.

This report was prepared in accordance with the following documents:

- Region 9 Standard Operating Procedure 906, *Guidelines for Data Review of Contract Laboratory Program Analytical Services (CLPAS) Inorganic Data Packages*;

III. VALIDITY AND COMMENTS

A. The 0.77 µg/L result for sample OC2-MW18C-W-0-193 (SDG 1764) is above the method detection limit (MDL) but below the practical quantitation limit (PQL) and should be estimated.

Results above the MDL but below the PQL are considered qualitatively acceptable but quantitatively unreliable due to uncertainties in the analytical precision near the limit of quantitation.

DATA QUALIFIER DEFINITIONS FOR INORGANIC DATA REVIEW

The definitions of the following qualifiers are prepared in accordance with the document *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, October 2004.

U	The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.
UJ	The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
